## **MobilSense Expands Offering to Include Online Provisioning & Asset Tracking**

### **MobilSentry 6.0 Includes the Ability to Order New or Replacement Handsets Including Workflow Authorization**

**Westlake Village, April 27, 2006** – MobilSense Technologies of Westlake Village today announced the immediate release of MobilSentry 6.0, and the availability of the new MobilSentry Order Manager™ provisioning module and expanded Asset Tracking capabilities.

Now MobilSentry users will have the ability to order phones, PDAs or data cards, implement cost center assignments and select pre-approved rate plans and options by following a set of client-specific prompts directly within the application.

“While there are a variety of ways to order equipment online today, our clients and prospects have been seeking a mechanism that more tightly integrates those orders with the wireless management control processes offered through MobilSentry,” said Dave Stevens, MobilSense CEO. “Not all carriers are able to assign equipment charges to device numbers in their electronic invoices. This newly integrated MobilSentry capability will not only automate existing manual ordering and approval processes but also provide for a closed-loop system that can track and assign device charges automatically where the carrier is unable to do so in their billing information.”

Standardizing wireless provisioning across multiple wireless carriers will bring new cost efficiencies to corporate wireless administration. MobilSentry Order Manager™ will provide one simple interface that incorporates all existing carrier solutions while limiting orders to only corporate-approved handsets and rate plans.

In conjunction with Order Manager, MobilSentry 6.0 now delivers new Asset Tracking capabilities that can be displayed and monitored through MobilSentry’s comprehensive reporting facility. Along with MobilSentry’s automated identification of unused services, this new asset tracking capability will make reuse of mobile handsets even easier.

## **About MobilSense**
